TITLE: Microspectrophotometric investigation of the influence of dislocations on the stability of F centers in NaCl crystal phosphors /Report, Fourteenth All-Union Conference on Luminescence (Crystal Phosphors) held at Riga, 16-23 Sept. 1965/

SOURCE: AN SSSR, Izvestiya. Seriya fizicheskaya, v. 30, no.9, 1966, 1477-1478

TOPIC TAGS: color center, sodium chloride, silver, x ray irradiation, thermal stability, crystal lattice dislocation

ABSTRACT: The authors employed the microspectrophotometric technique of V.I. Sidlyarenko, F.N. Zaitov, and Yu.L. Lukantsever (Optika i spektroskopiya, 13, 143 (1962)) to investigate the thermal bleaching of F centers in regions with linear dimensions of the order of 0.01 cm in x irradiated NaCl crystals grown by the Kyropoulos technique and containing 0.2 mole percent Ag. The investigation was undertaken because a correlation had previously been found between the thermal stability of F centers and the density of dislocations in individual alkali halide crystals and it was desired to determine whether this correlation would extend to different regions of the same crystal. Thermal bleaching of the F centers was found to take place in two stages.

Cord 1/2

ACC NR: AP7004978

The temperature at which the first (low temperature) stage of the thermal bleaching occurred varied from region to region and was higher in the regions with the higher dislocation densities, while the temperature at which the second stage took place was the same (from about 475 to 575° K) in all the regions. It is concluded that the presence of dislocations contributes to the low temperature thermal stability of E centers, but not to the high temperature thermal stability thereof. A brief explanation of the observed correlation is given in terms of the ionic thermal bleaching mechanism of Y.L.Lukantsever and F.N.Zaitov (Izv. AN SSSR. Ser.fiz.,25, 473 (1961)). The authors thank Yu.L.Lukantsever and F.N.Zaitov for their interest in the work and for valuable discussions. Orig. art. has: 1 figure and 1 table.

403. Function of active centre of trypsin in formation of complex with ovomucoid. M. P. Chernikov and V. O. Spikiter. *Dokl. Akad. Nauk, S.S.S.R.*, 1955, 104: 750-752; *Referral Zh. Biol.*, 1956, Abstr. No. 68987.—The complex formed by the interaction of ovomucoid with trypsin [A] differs from its components in S and electrophoretic activity. Investigation of the sedimentation was carried out by means of Svedberg's oil centrifuge at 81,000 r.p.m. (250,000 g.) and rotor temp. of 21°. The ovomucoid was obtained by fractionating egg white with Na trichloroacetate and alcohol. Diisopropylphosphoryl trypsin [B] was obtained by the action of a large excess of diisopropylfluorophosphate [C] on a soln. of cryst. A in phosphate buffer, pH 7.9. On the basis of sedimentation measurements of a mixture of ovomucoid with different concn. of B with active A, and with both A and C, it is concluded that active A forms a complex which sediments much faster than its components. Inactive B does not form a complex. These conclusions are supported by electrophoretic experiments. The inhibition of A by C leading to almost complete lack of proteolytic activity is apparently connected with the inability of B to form a complex which points to the decisive rôle of the active centre of A in complex formation with proteins. TOPIC TAGS: polyacrylonitrile, synthetic fiber, thiocyanate, acetic acid, chemical synthesis

ABSTRACT: The authors discuss the preparation of this compound, used in the synthesis of cationic dyes for polyacrylonitrile fibers, by means of the treatment of 4-anisidine with (SCN)₂ obtained in the reaction mass of cupric thiocyanate. The optimal adjustment of various parameters (temperature, reaction time, ratio of acetic acid to anisidine, etc.) allows obtention of 98 percent conversion and 88 percent yield with maximal purity of the finished product. TITLE: The Time Magnifier and its Applications

PERIODICAL: Sdělovací technika, 1960, Nr 1, pp 11-13

ABSTRACT: The described instrument makes it possible when used with oscillograph Křižík T 531 connected as a synchroscope, to control a complete TV signal. A schematic presentation of the time magnifier is in Fig 1 and its general circuit diagram in Fig 2. The TV signal is brought to the input electron tube E1a connected as a cathode phase converter. The control grid of the second tube E2a is fed over a high resistance directly from the anode source. The synchronization mixture is led to the integration circuit composed of three parts; its time constant must be sufficiently great to prevent the circuit from reacting to lineary synchronization pulses. Through an increase of the transconductance of the pulse edge the accuracy of synchronization was equally improved. On the output of the amplifier a

Effect of neosarsphenamine (neosalvarsan) on the intermediate metabolism of ascorbic acid in guinea pigs. Z. I. Spilioti. *Vopr. Med. Khim.* 5, 73-80 (1959). *Referat. Zhurn. Khim.* 1953, No. 7011. The animals were fed a ration of oats, hay, beets, cabbage, and water. One group of 45 animals was a control. The 2nd group of 49 animals received daily subcutaneously neosarsphenamine (II) so calcd. that it amounted to 20 mg./kg. of body wt. The 3rd group of 12 animals received I and 100 mg. of ascorbic acid (II) per os. The expt. lasted 20-25 days. In the animals of the 2nd group were observed symptoms of poisoning by I, absent in the 3rd group. In a study of the liver by the thymol test with blood serum the animals of the 1st group all gave neg. results, animals of the 2nd group all pos. results, and the animals of the 3rd group gave 75% neg. and 25% weakly pos. results. In the animals of the 2nd group were observed degenerative changes in the parenchyma of the liver of the type of protein degeneration and fat regeneration. The activity of alk. phosphatase of the plasma detd. by the Bodansky method was in the 1st group 4.4, in the 2nd group 2.6, and in the 3rd 4.7 units. The wt. of the suprarenal gland per 100 g. of body wt. was an av. of 54 mg. in the 1st, 103 mg. in the 2nd, and 73 mg. in the 3rd group. The concn. of II in the suprarenal glands of the animals of the 1st group was an av. of 41 mg. %, in the 2nd group 14 mg. %, and in the 3rd group 83 mg. %. The concn. of II in the liver did not change. Introduction of II simultaneously with I prevents the above-mentioned disturbances in the metabolism of II. It is concluded that while treating with org. derivs. of As it is advisable to introduce into the organism large doses of II in order to decrease injury to the liver, prevent the metabolism of II, and prevent the impoverishment of the organism in II. M. Hosh.

ORG: Ukrainian Scientific Research Tube Institute (Ukrainskiy nauchno-issledovatel'skiy trubnyy institut); Nikopol' Southern Tube Plant (Nikopol'skiy yuzhnotrubnyy zavod)

TITLE: Quality control of thin-walled tubes 18

SOURCE: Defektoskopiya, no. 1, 1966, 24-34 14

TOPIC TAGS: ultrasonic flaw detector, flaw detection, metal tube, quality control/UDT-4 ultrasonic flaw detector, IDTs-3M ultrasonic flaw detector 26

ABSTRACT: The article presents the results of the research and development work on UDT-4 ultrasonic flaw finders at the Ukrainian Scientific Research Tube Institute and compares their performance with that of the IDTs-3M ultrasonic flaw finder. The UDT-4 pulsed ultrasonic flaw finder is designed for the quality control of thin-walled tubes through the excitation of normal waves in their walls. It consists of an electronic unit and a mechanical-acoustical part. The inspected tube is drawn through the device. If a flaw is present, a lamp glows on the panel of the electronic unit and at the same time the tube-drawing mechanism halts. The defective spot is pinpointed and subse-

Card 1/2

UDC: 620.179.16

L 28164-66

ACC NR: AP6010271

quently metallographically examined. The UDT-4 reliably reveals defects of the scale, film, scratch, crack and other types. Compared with the IDTs-3M the UDT-4 has a slower tube-drawing mechanism. On the other hand, the IDTs-3M is inferior in that it cannot be used to inspect bent or curved tubes and it involves vibration of the tube, which generates spurious signals. This comparison implies that a new flaw finder embodying the advantages of both devices can be developed. The UDT-4 in its present form may be used for high-speed flaw detection in shops fabricating a broad range of thin-walled precision tubes if the device is so modified as to use several ultrasonic pickups aligned along the tube axis. Thus, e.g. if 5-6 pickups with beam width of 10 mm each are used to inspect tubes rotating at the rate of 200 RPM, a productivity of approximately 600 m/hr or more than 4000 m per shift may be achieved. In mass production of tubes of a limited range of types, on the other hand, it is best to use ultrasonic flaw finders with a series of pickups mounted over the tube perimeter. TITLE: Production method for sintered heat- and corrosion-resistant
aluminum alloys. No. 6080-61

SOURCE: Hutnicke listy, no. 11, 1964, 834

TOPIC TAGS: aluminum, alloy, sintered alloy, heat resistant alloy,
corrosion resistant alloy, SAP alloy

ABSTRACT: A patent has been issued for a production method for sintered heat- and corrosion-resistant aluminum (SAP) alloys. First, an alloy with 8—12% silicon and a low content (up to 3%) of nickel and titanium is melted. This alloy is atomized to a powder with 1—2% Al_2O_3 . The Al_2O_3 content is increased to 6—15% by grinding the powder mixed with gasoline in a vibrating mill. The powder is then processed into sintered articles.

The technological possibilities of utilizing the biochemical properties of oat kernels. Josef Spinka. *Chem. Listy* 33, 38-45, (9) 9(1939). Oats from the Labe (Elbe) lowlands of Bohemia contained N substances 9.2%, carbohydrates 56.1, cellulose 9.8, P_2O_5 in the ash 35.8 and K_2O in the ash 19.0%. Oats from the highlands of southern Bohemia contained N substances 11.6, carbohydrates 53.7, cellulose 12.0, P_2O_5 in the ash 41.6 and K_2O in the ash 19.7%. Oats grown on the highlands contained a higher percentage of biochem. elements than the same variety of oats grown in the lowlands. In oat kernels the contents of albumins, fats (sterols, lecithin, xanthophylls, carotenoids, and an olefin hydrocarbon), S, Fe, As, SiO_2 and porphyrins were higher than for other cereals. The enzyme content of oat kernels was low; oats formed fewer enzymes during fermentation than the other cereals formed. The fermenting oat kernels contained a growth hormone (blastanin and auxin) identified as a dihydroxylactone. From unfermented kernels

S. prepd. a hormone which after subcutaneous injections into mice lowered the level of blood Ca. The alkaloid avenine postulated by Sanson could not be located in oat kernels; the beneficial effect of oat kernels in the diet of patients suffering from a neuro-muscular ailment is ascribed to the action of other substances (lecithin and a cortin-like hormone). S. investigated the use of oat kernels in the prepn. of (a) flours, especially those for children's diets for which oats grown on the highlands is preferable, (b) foods and diets for diabetics and asthenics, (c) pharmacol. exts. which have a tonic or a sedative action, (d) cosmetic powders, (e) bath salts and lotions, (f) pastes and poultices for the treatment of skin burns, (g) starch or dextrin adhesive pastes, (h) oat flours for the preservation of bacon, potatoes, nuts, margarine, mayonnaise, (some constituent, possibly the carotenoids, prevents rancidity in the fats). Oat hulls and straw are suitable for the prepn. of lactic acid, AcOH and furfural (for the prepn. of artificial plastics); they were not suitable for the prepn. of EtOH (owing to the contamination by butyric acid) and vanillin (owing to high costs).

The detailed analyses and expts. conducted by S. on oats grown in Czechoslovakia are supplemented by tables of analyses of oats conducted in neighboring countries.

1670. CLINICAL DATA ON SECONDARY AVASCULAR NECROSIS OF THE HEAD OF THE FEMUR IN CHILDREN - Klinický příspěvek k druhotné avaskulární nekrose hlavičky kyčelního kloubu u dětí - Špinka J. II. Chir. Klin., Lék. Fak., KU, Plzeň - ACTA CHIR. ORTHOP. TRAUM. CEC. 1958, 25/3 (181-190) Illus. 4

The head of the femur is only rarely fractured in children; most frequently these fractures occur in the cervico-trochanteric area. Relatively frequent are fractures that have the form of subperiosteal bone fissures. In these are not overlooked they usually are not serious and heal rapidly, and the results are satisfactory. Frequently, however, after a period free from complaints symptoms of gross anatomical damage of the joint appear as the injury has seriously affected the nutrition of the growing epiphysis which has become necrotic. The case is reported of a boy aged 14 yr. who sustained a subperiosteal fracture in the subtrochanteric area and in whom necrosis of the femoral head developed, in spite of careful primary treatment and a symptom-free period of 9 months. Measures to prevent or limit the resulting disability are discussed.
